

Exploratory analysis of Haak Human Origins data

From the Haak + Human Origins dataset, we extracted overall 403 samples (both modern and ancient) that were used in Figure 1 (Haak et al). There were in total 21 ancient populations with varying sample sizes and 23 modern populations from which the samples were considered. We fitted the admixture model due to David Alexander (UCLA) [software](#). We first show the admixture analysis for $K = 3, 5, 7$.
